--A system and method for treating hypothermia utilize an inflatable device with an undersurface for expelling warmed air and a heater/blower assembly for inflating the inflatable device with warmed air. In one embodiment, the warmed air expelled through the undersurface is maintained in a temperature range of ~~85°F to 117°F~~ ^{85.2°F to 117.7°F}. In another embodiment, the warmed air with which the inflatable device is inflated is maintained in a temperature range of ~~113°F to 121°F~~ ^{113.3°F to 121.3°F}. Various features in the structure of the inflatable device provide increased average temperature of the warmed air with which the inflatable device is inflated. These features include side vents and aperture density patterns in the undersurface.
